**ESTIMATED ANNUAL GROUND-WATER PUMPAGE  
1994 – 2004  
SMITH VALLEY AND MASON VALLEY  
LYON COUNTY, NEVADA.**

By Thomas K. Gallagher

Prepared in cooperation with the  
United States Geological Survey and with other agencies

## PREFACE

This report is one in a series of reports of estimated ground-water pumpage compiled by the Nevada Division of Water Resources beginning in 1994. The author wishes to acknowledge the people of Smith and Mason Valleys for their cooperation in this effort. Thanks especially to the members of the Division's Engineering staff, who have contributed extensively and have made this work possible. Thanks also to Ken Spooner, the Walker River Irrigation District and Chief Deputy Water Commissioner Jim Shaw. The assistance of the Desert Research Institute, the Natural Resources Conservation Service, Sierra Pacific Power Company and the United States Geological Survey is also appreciated.

## **EXECUTIVE SUMMARY**

The Nevada Division of Water Resources collected field data from large capacity irrigation wells, fish hatchery wells, municipal and other well sites to determine discharge rates and total annual pumpage from Smith Valley and Mason Valley. This report provides estimated gross ground-water pumpage by well location for calendar years 1994-2004 and updates gross pumpage and site data for wells that had poor estimates or were either not included or were not pumping during site visits in previous years.

### **Hydrographic Setting and History**

Smith Valley and Mason Valley are two adjacent alluvial basins located in Western Nevada, lying within portions of Douglas, Lyon and Mineral Counties, and within the western part of the Great Basin, (see vicinity map). These valleys make up a portion of the Walker River watershed, which has its headwaters high on the eastern slope of the Sierra Nevada Mountains. The West Fork of the Walker River watershed above Antelope Valley and Coleville has an area of about 250 square miles and the East Fork watershed above Bridgeport comprises about 359 square miles. The runoff generated by snowmelt in this high country occurs primarily in April, May and June. Two significant storage reservoirs on the stream system are at Topaz Lake, straddling the California-Nevada state line, and Bridgeport Reservoir, just downstream of Bridgeport, California. Both were built with private moneys to control releases of water for irrigation in Smith and Mason Valleys. Topaz Lake is an off-stream storage facility completed in 1921 on the West Fork of the Walker with a usable capacity of 59,440 acre-feet. Bridgeport Reservoir was completed in 1924 on the East Fork and has a capacity of 42,460 acre-feet. Both reservoirs are used, operated and maintained by the Walker River Irrigation District.

The initial court decision adjudicating the water rights of the Walker River, known as Decree 731, was issued in 1919. The decree primarily quantified direct diversions from the river and tributaries and did not address storage rights. Distribution of the waters of the Walker River was more specifically set forth in 1936 by a U.S. Federal Court Decree, known as C-125, (United States of America v. Walker River Irrigation District et al) that incorporated the parties and rights of the earlier decree and addressed storage rights and the rights of the Walker River Paiute Tribe of Indians on reservation lands.

The West Fork of the Walker River crosses Smith Valley and flows east to the confluence with the East Fork in Mason Valley. The main stem continues north and east out of Mason Valley to Weber Reservoir for irrigation on tribal lands and then continues south to its terminus at Walker Lake. The economy of the area is largely irrigated agriculture.

#### Precipitation

The average annual precipitation ranges from about 5 inches per year on the valley floor to about 20 inches in the surrounding mountains. The average frost-free growing season above 32°F and 24°F is about 110 days and 200 days, respectively.

**The mean annual precipitation values for Yerington, Smith and Topaz are 5.35, 6.68 and 9.72 inches respectively. The total precipitation recorded by these respective sites for calendar 2004 is 4.30, 6.01, and 4.34 inches.** The monthly and annual precipitation data for these three sites are available at Western Regional Climate Center's website <http://www.wrcc.dri.edu/summary/climsmnv.html> (Desert Research Institute Western Regional Climate Center unpublished data).

#### Stream flow

The discharge or runoff of the West Walker River at Hoye Bridge, near Wellington, Nevada has a 1910-2004 average of 177,500 AF. The West Walker River at Wilson Canyon, near Hudson, Nevada has a 1915-2004 average of 142,000 AF. The East Walker River above Strosnider Ditch near Mason, Nevada has a 1948-2004 average of 108,300 AF. The Walker River outflow from Mason Valley near Wabuska, Nevada has a 1902-2004 average of 119,900 AF. The annual runoff data are obtained from the gaging station record in the United States Geological Survey (USGS) Annual Data Reports on line at <http://nevada.usgs.gov/ADR/index.htm>. The annual discharge data is shown on the following table and graphs, immediately following this section.

#### Ground-water Levels

Annual springtime static ground-water levels have been collected by the Division since the early 1970's. These water levels give an indication of the impact of recharge and the stress from pumping the aquifer in the preceding year. Generally, during "wet years", the water level rise in both valleys reflects the impact of above average mountain snow pack and stream flow and the coinciding small ground-water

withdrawals during the following irrigation season. During drought periods, the reverse is generally true, as is indicated by water level drops in the years following below average snow pack and stream flow. Fluctuations in ground-water levels from year to year are generally the greatest where the wells are located away from the main stem of the stream and in the south and east parts of Mason Valley.

### **General Background**

There are about 100 well sites in Smith Valley and about 200 well sites in Mason Valley that were established in the data base for the purposes of this study. These included sites where pumpage was likely to be significant (not including domestic use sites); in almost all cases, the site use was irrigation. The database also includes small duty permits or sites that were not pumped or are abandoned.

The discharge rate of each well site was measured in the field by several methods. Every attempt was made to obtain the most accurate instantaneous well discharge since these flow rates were later expanded to daily and annual rates. The number of days of pumping for each site was then determined from electric meter readings, that is, the electric meter was essentially used as a clock. Generally, in these two valleys, the electric consumption per day stayed roughly constant throughout the year and from year to year, as is verified by data collected in this study. Annual discharge was determined for all sites that had accurate flow rate measurements and electric (time) clock records.

All estimates of annual well discharge are shown in Table 3 for Smith Valley and Table 6 for Mason Valley, and these tables are sorted on well location. The well location numbering system is described in Appendix A. The reason for this layout is that annual discharge was associated with an actual well in the field, not with a permit number, and due to the fact that a well site in many cases has more than one permit associated with it.

In order to determine pumpage associated with a permit, find the well location associated with the permit in Table 1 for Smith Valley or Table 4 for Mason Valley, then use the other tables to determine ground-water pumpage and other site information.

As of February 1, 2000, the State Engineer required all wells to be equipped with functioning totalizing flow meters in the well discharge line. Flow meter readings were taken to determine instantaneous flow rates and estimates by the electric meter/clock method were also computed for comparison. In all cases where the flow meter readings were considered accurate, the estimated total pumpage for that site was the

value determined by the flow meter only. The electric meter method of estimating annual discharge gave surprisingly accurate total values in many cases. Five years of metered pumpage has confirmed the accuracy of the earlier estimates, and in some cases has provided for corrections in earlier estimates.

Well discharge data for some sites were not available since the wells were abandoned, were not pumping during site visits or had complicated plumbing at the wellhead.

The water right and annual duty information for each valley is included in Table 1 and Table 3 and it is sorted on permit number. The water duty is generally the maximum amount of ground water that can be pumped under that permit, and generally, that amount is supplemental to a water right from the stream system. The amount of water pumped, divided by the permitted or certificated acreage, gives a theoretical application rate of feet of water per acre. Four (4) acre feet per acre is typically assigned as a condition of permit for these valleys. For ground-water rights that supplement surface-water rights, the total duty is four (4) acre feet per acre from all sources. Nearly all irrigation well permits are supplemental to surface-water rights in these valleys.

Tables 2 and 5 have the same water right permit and annual duty information as in Tables 1 and 3 but are indexed on site location.

Approximately 485 domestic use wells contribute about 1000 acre-feet of ground-water pumpage annually in Smith Valley. Approximately 910 domestic use wells contribute about 2000 acre-feet of ground-water pumpage annually in Mason Valley. These values are estimates only using the statutory allowance for domestic wells of 1,800 gallons per day per well and are not included in the major use estimate for each valley.

In conclusion, this report of gross annual pumpage includes data for the years 1994 – 2004. Even though earlier publications exist that address Smith and Mason Valley ground-water pumpage, all years since the inception are included in this report because many sites may have been updated due to more field data and due to metered values. The site information will continue to be refined and checked for accuracy and the withdrawal data may be valuable in future computer modeling efforts.
